

## Task Priority not compatible with mismatched scheduled Task assignments

**The information in this article applies to the Task Priority feature in Prism Deploy versions 11.0 and later.**

The Task Priority feature in Prism Deploy allows you to assign more than one task to a PC or group of PCs and to set a specific order for the Tasks to run (1, 2, 3..). However, the priority order may not work as expected if you choose to prioritize Tasks that have already been assigned using various scheduling options for Install or Reinstall, such as "Install after", "Reinstall after", "Reinstall on first logon after...", etc.

Let's look at a screen shot of various task schedule assignments properties.

The screenshot shows the Prism Deploy interface with a table of task assignments. The table has columns for Icon, Name, and Schedule. A red box highlights the Schedule column, which contains various scheduling options for eight test tasks.

Icon	Icon	Name	Schedule	As
✓	📁	TestTask1	Reinstall after 2/2/2017 11:14:02 AM on target computer	c:\taskpr
✓	📁	TestTask2	Install after 7/8/2014 12:35:37 PM on target computer	c:\taskpr
✓	📁	TestTask3	Reinstall after 12/19/2016 12:35:40 PM on target computer	c:\taskpr
✓	📁	TestTask4	Reinstall on first Logon after 2/2/2017 3:17:25 PM on target comp...	c:\taskpr
✓	📁	TestTask5	Install after 7/8/2014 12:35:37 PM on target computer	c:\taskpr
✓	📁	TestTask6	Reinstall on first Logon after 7/18/2016 11:14:02 AM on target co...	c:\taskpr
✓	📁	TestTask7	Install after 7/8/2014 12:35:37 PM on target computer	c:\taskpr
✓	📁	TestTask8	Install after 7/8/2014 12:35:37 PM on target computer	c:\taskpr

As you can see, there are eight tasks, all with various task schedule assignment properties. Because all of the tasks have previously been deployed with schedules, the prioritized tasks won't install this time in their intended priority order. For Tasks to install in the priority order you want, all the Tasks must have the same installation schedule (such as Install or Reinstall). All other Task execution properties such as "Allow unattended installation" and "Run as" need to match as well.

Here is an example of task scheduling assignment properties matching;

The screenshot shows the Prism Deploy interface with a table of task assignments. The table has columns for Icon, Name, Schedule, and Assigned. All tasks have the same schedule of "Install" and are assigned to "c:\taskpr".

Icon	Icon	Name	Schedule	Assigned
✓	📁	TestTask1	Install	c:\taskpr
✓	📁	TestTask2	Install	c:\taskpr
✓	📁	TestTask3	Install	c:\taskpr
✓	📁	TestTask4	Install	c:\taskpr
✓	📁	TestTask5	Install	c:\taskpr
✓	📁	TestTask6	Install	c:\taskpr
✓	📁	TestTask7	Install	c:\taskpr
✓	📁	TestTask8	Install	c:\taskpr

## Task Priority not compatible with mismatched scheduled Task assignments

As you can see, the Task scheduling assignment on the prioritized is now identical, and the Tasks will run in the proper priority order
